

Advanced Email Security

Stop the #1 cause of business compromise before it reaches the inbox.

Over **90%** of all successful cyberattacks start with a **single**, convincing email. While the default security built into Microsoft 365 and Google Workspace catches **obvious** spam, modern cybercriminals use highly sophisticated, targeted attacks specifically designed to bypass those standard filters.

At Breakwater IT, we protect your most vulnerable communication channel. We go far **beyond** basic spam filters, deploying an advanced, AI-driven security layer that integrates seamlessly into your digital workspace.

We neutralise spear-phishing, malicious links, and impersonation attempts in milliseconds—ensuring dangerous emails are destroyed before your staff ever has the chance to click.

- **Beyond Native Defenses:** Standard email filters look for known bad senders. Our enterprise-grade AI actively analyzes the tone, financial requests, and historical context of every message, catching the sophisticated impersonation attempts that slip right past Microsoft and Google.
- **Invisible, Frictionless Protection:** Security shouldn't slow down business. We integrate directly into your existing email environment without changing your mail routing. It's completely invisible to attackers and requires zero new software or clunky quarantine portals for your team to learn.
- **Internal Threat & Account Takeover Prevention:** If a trusted vendor or a compromised employee account suddenly starts sending malicious invoices, standard filters won't catch it because the sender looks legitimate. We scan internal and vendor communications to instantly quarantine hijacked accounts before the threat spreads.
- **Real-Time Link & Attachment Sandboxing:** We don't just scan an email when it arrives; we protect your team when they interact with it. Every attachment is deeply inspected, and every link is analyzed in real-time. If a destination is malicious, access is blocked immediately.
