

## Dark Web Monitoring

**Discover compromised corporate credentials before they become a data breach.**

The dark web sounds like a concept from a movie, but it is a very real, highly organized marketplace where cybercriminals buy and **sell** stolen corporate **data**. Because employees frequently reuse passwords across personal and professional apps, a data breach at a seemingly harmless third-party website can instantly hand hackers the keys to your business.

At Breakwater IT, we shine a light on your blind spots. We deploy enterprise-grade intelligence tools to continuously scan hidden forums, illicit marketplaces, and private chat rooms for your company's compromised credentials, alerting you the moment your data is exposed.

**24/7 Credential Surveillance** We constantly monitor the deep and dark web for your specific business domains and email addresses. If an employee's password, username, or personal information is dumped online, we know about it immediately.

**Third-Party Breach Protection** Your internal network might be perfectly secure, but you can't control the security of every vendor you use. When a third-party supplier, software platform, or website suffers a breach that exposes your team's login data, we catch the leak and lock down your systems before hackers can exploit it.

**Immediate Remediation** Finding a stolen password is only helpful if you do something about it. When our systems detect a compromised credential, we step in immediately. We proactively force password resets, terminate active login sessions, and secure the exposed account before your workday even begins.

## Do you know if your company passwords are currently for sale?
