

Secure Remote Workforce

Protection that travels wherever your team works

The modern office has no walls. Your team needs the **flexibility** to work from home, client sites, or airport lounges—but every time an employee connects to an outside Wi-Fi network, your company data is exposed to entirely new risks. The traditional office firewall is no longer enough.

At Breakwater IT, we build security that follows your people, not your building. We deploy a **seamless**, enterprise-grade protective layer to every laptop and mobile device in your fleet. We ensure your remote workers have fast, frictionless access to the tools they need, while remaining completely shielded from compromised networks, malicious websites, and identity theft.

Zero-Trust Remote Access We replace slow, frustrating legacy VPNs with modern, frictionless access controls. We verify exactly who is logging in and what device they are using, ensuring your team gets fast, secure access to company data without exposing your entire network to the public internet.

Everywhere Web Defense Protection shouldn't stop when an employee unplugs from the office network. We deploy advanced, device-level web filtering that blocks malicious links, phishing sites, and malware downloads in real time, even when your staff is working on a public coffee shop Wi-Fi.

Active Identity Protection Compromised passwords are the keys to your kingdom. We actively monitor your cloud environment and user identities 24/7. If a login attempt occurs from an impossible location or a trusted account starts behaving suspiciously, our team instantly isolates the threat before an account takeover can happen.

Total Device Control Laptops get left in Ubers, and phones get lost. We implement rigorous mobile device management across your entire fleet. By enforcing hard-drive encryption and maintaining the ability to remotely wipe business data from a lost device, we turn a potential data breach into a minor inconvenience.
