

## Vulnerability Management

Find and fix your security gaps before threat actors do

Most cyberattacks don't start with a targeted, sophisticated hack. They start when automated bots scan the internet and find an open digital window—like an **outdated** web browser, an **unpatched** PDF reader, or a **misconfigured** router. If you don't know these hidden vulnerabilities exist, you cannot defend against them.

At Breakwater IT, we act as your proactive defense team. We don't just wait for an antivirus alarm to go off; we actively hunt for weaknesses across your entire digital environment. By continuously scanning your systems, identifying security gaps, and patching them silently in the background, we close the doors before a threat actor ever realizes they are unlocked.

## Proactive, not reactive.

**Continuous Threat Scanning:** Cyber threats evolve daily. We deploy enterprise-grade scanning agents across your entire fleet of laptops, servers, and network devices to continuously map your environment and identify outdated software or risky configurations in real time.

**Intelligent Risk Prioritization:** Not every software bug requires an emergency shutdown. Our senior engineers analyze the scan data to separate the noise from the critical threats, prioritizing the vulnerabilities that actually pose a real-world risk to your specific business operations.

**Silent & Automated Patching:** Security shouldn't disrupt your workday. Once a vulnerability is identified, we deploy the necessary security patches and updates directly to your devices in the background, keeping your staff completely uninterrupted and productive.

**Insurance & Compliance Validation:** Simply having a firewall is no longer enough to secure a payout after a breach. We provide the hard data and reporting required by major cyber insurance carriers and compliance frameworks (like SMB1001), proving that your business is actively maintaining a hardened environment.
